

## Hypersensitivity and INGREZZA<sup>®</sup> (valbenazine) Capsules and INGREZZA<sup>®</sup> SPRINKLE (valbenazine) Capsules in Patients with Chorea Associated with Huntington's Disease

Thank you for contacting Neurocrine Biosciences with your unsolicited Medical Information request regarding the potential effects of INGREZZA and INGREZZA SPRINKLE and hypersensitivity.

INGREZZA and INGREZZA SPRINKLE are vesicular monoamine transporter 2 (VMAT2) inhibitors indicated for the treatment of adults with chorea associated with Huntington's disease (HD).<sup>1</sup>

Please review the separately attached FDA-approved full Prescribing Information and Important Safety Information, including a Boxed Warning.

The FDA-approved full Prescribing Information states:<sup>1</sup>

### CONTRAINDICATIONS

INGREZZA and INGREZZA SPRINKLE are contraindicated in patients with a history of hypersensitivity to valbenazine or any components of INGREZZA or INGREZZA SPRINKLE. Rash, urticaria, and reactions consistent with angioedema (e.g., swelling of the face, lips, and mouth) have been reported with the use of INGREZZA.

### WARNING AND PRECAUTIONS

#### Hypersensitivity Reactions

Hypersensitivity reactions, including cases of angioedema involving the larynx, glottis, lips, and eyelids, have been reported in the postmarketing setting in patients after taking the first or subsequent doses of INGREZZA. A case of angioedema involving the lips and face, with rash and shortness of breath was reported in a patient with Huntington's disease taking INGREZZA during a clinical study. Urticaria and rash were also reported during a clinical study in patients with Huntington's disease. Angioedema associated with laryngeal edema can be fatal. If any of these reactions occur, discontinue INGREZZA or INGREZZA SPRINKLE.

### Clinical Study Results:

In KINECT<sup>®</sup>-HD, the Phase 3, double-blind placebo-controlled study to evaluate the safety and efficacy of valbenazine for the treatment of chorea associated with HD, adverse events of urticaria, rash, angioedema, and pruritus occurred in the valbenazine (VBZ) group and pruritus in the placebo (PBO) group (**Table 1**).

Angioedema was reported in 1 patient in the VBZ group and was a serious adverse event. The angioedema was considered by the investigator to be unlikely related to study treatment (likely cause, shellfish allergy) and resolved within a day. The patient continued treatment and completed the study on 80 mg.<sup>2</sup>

**Table 1: KINECT-HD TEAE**

	Placebo (N=63) n (%)	Valbenazine (N=64) n (%)
Urticaria	0	6 (9.4)
Rash	0	5 (7.8)
Angioedema	0	1 (1.6)
Pruritus	1 (1.6)	1 (1.6)

The most common treatment-emergent adverse events (TEAEs) with valbenazine in the KINECT-HD study were somnolence and fatigue.<sup>2</sup>

KINECT-HD2, is an ongoing Phase 3, open-label rollover study to evaluate the long-term safety and tolerability of valbenazine for the treatment of chorea associated with HD. Full results and analysis of this study is expected once the study is complete.

### Postmarketing Experience:

As the Prescribing Information states, “hypersensitivity reactions, including cases of angioedema involving the larynx, glottis, lips, and eyelids, have been reported in the post-marketing setting in patients after taking the first or subsequent doses of INGREZZA. Because these reactions are reported voluntarily from a population of uncertain size, it is not always possible to reliably estimate their frequency or establish a causal relationship to drug exposure.”<sup>1</sup>

### IMPORTANT SAFETY INFORMATION

**Depression and Suicidality in Patients with Huntington’s Disease: VMAT2 inhibitors, including INGREZZA and INGREZZA SPRINKLE, can increase the risk of depression and suicidal thoughts and behavior (suicidality) in patients with Huntington’s disease. Balance the risks of depression and suicidality with the clinical need for treatment of chorea. Closely monitor patients for the emergence or worsening of depression, suicidal ideation, or unusual changes in behavior. Inform patients, their caregivers, and families of the risk of depression and suicidal ideation and behavior and instruct them to report behaviors of concern promptly to the treating physician. Exercise caution when treating patients with a history of depression or prior suicide attempts or ideation, which are increased in frequency in patients with Huntington’s disease.**

### CONTRAINDICATIONS

INGREZZA and INGREZZA SPRINKLE are contraindicated in patients with a history of hypersensitivity to valbenazine or any components of INGREZZA or INGREZZA SPRINKLE.

### WARNINGS & PRECAUTIONS

#### Hypersensitivity Reactions

Hypersensitivity reactions, including cases of angioedema involving the larynx, glottis, lips, and eyelids, have been reported in patients after taking the first or subsequent doses of INGREZZA. Angioedema associated with laryngeal edema can be fatal. If any of these reactions occur, discontinue INGREZZA or INGREZZA SPRINKLE.

#### Somnolence and Sedation

INGREZZA and INGREZZA SPRINKLE can cause somnolence and sedation. Patients should not perform activities requiring mental alertness such as operating a motor vehicle or operating hazardous machinery until they know how they will be affected by INGREZZA or INGREZZA SPRINKLE.

#### QT Prolongation

INGREZZA and INGREZZA SPRINKLE may prolong the QT interval, although the degree of QT prolongation is not clinically significant at concentrations expected with recommended dosing. INGREZZA and INGREZZA SPRINKLE should be avoided in patients with congenital long QT syndrome or with arrhythmias associated with a prolonged QT interval. For patients at increased risk of a prolonged QT interval, assess the QT interval before increasing the dosage.

#### Neuroleptic Malignant Syndrome

A potentially fatal symptom complex referred to as Neuroleptic Malignant Syndrome (NMS) has been reported in association with drugs that reduce dopaminergic transmission, including INGREZZA. The management of NMS should include immediate

discontinuation of INGREZZA or INGREZZA SPRINKLE, intensive symptomatic treatment and medical monitoring, and treatment of any concomitant serious medical problems. If treatment with INGREZZA or INGREZZA SPRINKLE is needed after recovery from NMS, patients should be monitored for signs of recurrence.

**Parkinsonism**

INGREZZA and INGREZZA SPRINKLE may cause parkinsonism. Parkinsonism has also been observed with other VMAT2 inhibitors. Reduce the dose or discontinue INGREZZA or INGREZZA SPRINKLE treatment in patients who develop clinically significant parkinson-like signs or symptoms.

**ADVERSE REACTIONS**

The most common adverse reactions in patients with chorea associated with Huntington's disease ( $\geq 5\%$  and twice the rate of placebo) are somnolence/lethargy/sedation, urticaria, rash, and insomnia.
